Expression vectors for transforming insect cells from disparate lines useful to express heterologous DNA, e.g. to allow study of gene expression and produce commercially important proteins.

Claim 10; Page 82; 121pp; English.

This represents a Orgyia pseudotsugata multicapsid nucleopolyhedrosis virus (OpMNPV) immediate early 2 (Op ie2) promoter sequence. The invention provides a new shuttle vector for transforming insect cells

```
carly baculovirus promoter; (iii) prokaryotic princationing as, an immediate early baculovirus promoter; (iii) prokaryotic promoter sequence, and (iv) selectable marker capable of conferring resistance to a bleomycin/ belowycin-type antibiotic under transcriptional control of (ii) and (iii), in insect and prokaryotic calls respectively. The vectors can be used to stably transform (especially insect) cells with heterologous DNA, useful to allow study of gene expression and direct expression of heterologous gene products e.g. commercially important proteins. They are especially useful to allow expression of the heterologous melanotransferrins, on transport peptide hormones or biologically active melanotransferrins, ion transport peptide hormones or biologically active insectional modification of particular proteins. Shuttle vectors turnes from disparate species, allowing screening of lines for optimum post translational modification of particular proteins. Shuttle vectors further comprising DNA transposable elements defining a transposon can be used to optimise heterologous protein expression and facilitate selection of desired transformants. (Updated on 17-OCT-2003 to standardise OS

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       portion of one or more viral/baculoviral genomes and further containing at least two recombination sites that do not substantially recombine with each other. One or more of the recombination sites is capable of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  124
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             184
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           181 GTAGACTATTTTACATAAATAGTCTACACCGTTGTATACGCTCCAAATACACTACCACAC 240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               undergoing recombination with a compatible recombination site in the presence of one or more proteins active in lambda recombination. The mucleic acid of the invention replicates in prokaryotic and eukaryotic cells. The mucleic acid of the invention is useful for constructing recombinant virus, generating replication-defective particles, and are useful as gene therapy vectors. The mucleic acid of the invention of one or more genes in an organism, and are useful for producing and expressing fusion polypeptides. The present DNA sequence represents the OpIE2 promoter that was used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         64
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel nucleic acid molecule comprising all or a portion of one or more viral genome and further comprising two or more recombination sites that do not substantially recombine with each other, useful as gene therapy.
                                                           replication-defective particle generation; gene expression inhibition; gene therapy vector; ds; OpIE2 promoter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CATGATGATAAACAATGTATGGTGCTAATGTTGCTTCAACAACAATTCTGTTGAACTGTG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to immunogenic analogues of multimeric proteins such as immunogenic variants of interleukin 5 (IL5) and tumour necrosis factor alpha (TRF, TNFalpha) and methods for production of immunogenic analogues. The immunogenic analogue is useful for preparing a composition for treating inflammatory diseases, e.g., arthritis. It is also used in

                                                                                                                                                                              δ
                                                                                                                                                                                                                                                                              The invention comprises a nucleic acid molecule consisting of all or a portion of one or more viral/baculoviral genomes and further containing at least two recombination sites that do not substantially recombine with each other. One or more of the recombination sites is capable of undergoing recombination with a compatible recombination site in the presence of one or more proteins active in lambda recombination. The nucleic acid of the invention replicates in prokaryotic cells. The nucleic acid of the invention is useful for constructing a recombinant virus, generating replication-defective particles, and are useful as gene therapy vectors. The nucleic acid of the any vectors. The nucleic acid of the invention is useful for producing and expression of one or more genes in an organism, and are useful for producing and expressing fusion polypeptides. The present DNA sequence represents a plasmid that was used in the

AAT13636-731 show open reading frames 13, 20, 22-30, 32, 38, 41-46, 50-60, 62-63, 66, 68-79, 81-87, 91-92, 96-98, 101-103, 106-127, 129-130, 140 -146, 148-150, 152 and 154 from a total of 154 ORFs identified in the Autographa californica nuclear polyhedrosis virus (AcNPV) clone 6. Each gene is numbered according to its position in the virus genome beginning that left end of the linear map, and irrespective of its orientation. The direction of transcription is relative to that of the polyhedrin gene. Of the 154 ORFs identified it was found that some of the ORFs (ORFs 77, 30, 32, 71, 86, 123, 126 and 127) are dispensable for virus replication in cell culture or insect larvae. These genes can be deleted from the genome to: (a) provide additional sites for inserting single or multiple copies of foreign genes; and (b) to reduce the size of the virus complementary strand relative to the polyhedrin gene. The present sequence is designated ORF 152, and is on the complementary strand relative to the polyhedrin gene. (Updated on 16-OCT-2003 to standardise

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a Bombyx mori (silk worm) polyhedrosis virus in which open reading frame 8 (ORF 8) gene is inactivated. The inactivated orfs gene is useful for suppressing movement of silkworm and efficiently prevents the movement of a silkworm from a chamber in which it is raised. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                mori polyhedrosis virus in which open reading frame gene is or its variant, useful for suppressing movement of Bombyx

The patent specification claims a polynucleotide selected from open reading frames (ORFs 13, 20, 22-26, 28-30, 32, 38, 41-46, 50-60, 62-63, 66, 68-79, 81-87, 91-92, 96-89, 101-103, 106-126, 129-130, 140-146, 148-150, 152 and 154 from a total of 154 ORFs identified by the patentees. See T13636-731. Expression vectors contg. the complete genomic sequence of AcNPV, with the exception that at least one non-essential ORF is disrupted or replaced are useful for the synthesis of heterologous proteins. (Updated on 16-OCT-2003 to standardise OS field)

The invention comprises a nucleic acid molecule consisting of all or a portion of one or more viral/baculoviral genomes and further containing at least two recombination sites that do not substantially recombine with each other. One or more of the recombination sites is capable of undergoing recombination with a compatible recombination of the presence of one or more proteins active in lambda recombination. The nucleic acid of the invention replicates in prokaryotic and eukaryotic cells. The nucleic acid of the invention replication defective particles, precombinant virus, generating replication-defective particles, and are useful as gene therapy vectors. The nucleic acid of the invention is useful for constructing a preventing/inhibiting the expression of one or more genes in an organism, and are useful as gene therapy vectors. The nucleic acid of the invention is also useful for producting and expressing fusion polypeptides. The present DNA sequence represents a recombination region of a plasmid that was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel nucleic acid molecule comprising all or a portion of one or more viral genome and further comprising two or more recombination sites that do not substantially recombine with each other, useful as gene therapy.
                                                                                                                                                                                           viral vector; recombination site; recombinant virus; replication-defective particle generation; gene expression inhibition; gene therapy vector; ds; plasmid; recombination region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Franke KE;

The present invention describes a method for detecting and differentiating between haematopoietic cell proliferative disorders associated with at least 1 gene and/or their regularcory regions in a subject. The method comprises contacting a target nucleic acid in a biological sample obtained from the subject with at least 1 reagent, which distinguishes between methylated and non-methylated CpG dinucleotides within the target nucleic acid. ABZ09861 to ABZ11118 represent specifically claimed nucleotide sequences from the present invention. Oligonucleotides from the present invention can be used: invention oligonucleotides from the present invention can be used: invention oligonucleotides from the present invention acide used: for differentiating between healthy haematopoietic cells and proliferative lymphocytic leukaemia and acute myelogenous leukaemia, as probes for determining the cytosine methylation state and/or single nucleotide polymorphisms (SNPs) of haematopoietic cell proliferation disorder related DNA amplification of haematopoietic cell proliferation disorder related buna
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Detecting and differentiating between hematopoietic cell proliferative disorders, comprises contacting a target nucleic acid with a reagent that distinguishes between methylated and non-methylated CpG dinucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          enables a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Pelet C;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          sequences. The nucleotide sequences from the present invention can also be used for detecting a predisposition to, differentiation between subclasses, diagnosis, prognosis, treatment and/or monitoring of haematopoietic cell proliferative disorders. The present method enables highly specific classification of haematopoietic cell proliferative
                                                                                                                                                                                                                                                  Haematopoietic cell proliferation disorder related DNA sequence #199.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 disorders allowing for improved and informed treatment of patients
                                                                                                                                                                                                                                                                                     Human; haematopoietic cell proliferation disorder; cytostatic; gene therapy; lymphocytic leukaemia; acute myelogenous leukaemia; cytosine methylation state; gene; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Howe A, Mueller J;

The invention relates to a nucleic acid comprising a sequence of 18 bases, of a segment of chemically pretreated DNA (CP DNA) e.g. with bases, of a segment of chemically pretreated DNA (CP DNA) e.g. with baseling to genes associated with fumour suppression and concequence having a sequence taken from 536 (actually 533 since numbers 408, 458 and 500 are missing from the sequence listing) sequences (Ss) and sequences complementary to (Ss). The nucleic acid may be a peptide nucleic acid-oligomer (PNA) of at least 9 nucleotides and may form part of a set of probes for detecting the cytosine methylation state and/or single cutleotide polymorphisms and also to be used in an array for analysing diseases associated with CpG dinucleotides e.g. cancers and tumours. The probes can also be used in a method for ascertaining genetic and/or epigenetic parameters for the diagnosis and/or therapy of existing diseases or the predisposition to specific diseases, by analysing cytosine methylations. The parameters may be compared to another set of partients and/or epigenetic parameters which are disadvantageous to patients. The present sequence is one of the 533 genomic sequences derived from tumour suppressor genes and oncogenes. Note: The sequence data for this patent did not form part of the printed specification, but two ont thybublished_pot_esquences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a method of detecting and differentiating between lymphoid cell proliferative disorders associated with at least one gene and/or their regulatory regions in a subject by contacting a target nucleic acid in a biological sample obtained from the subject with at least one reagent or series of reagents that distinguish between methylated and non-methylated CpG dinucleotides within the target nucleic acid. The genes and/or their regulatory regions are preferably selected from MDR1, CSMK2B, EGR4, AR, CDK4, RB2, CDC25A, GPIb beta, MYOD1, CDH3, MYCL1, ELK1, ABL1, APC, BCL2, CDH1, CDKN1A, CDKN1B, CDKN2B, FOS, GSK7P1, HIC-1, MGMT, MLH1, MOS, MYC, PTEN, RBL2, TGFBR2, TP73, CDKN1C, GSK3beta, ESR1, APAF1, BAK1, BAX or HOXAS. Oligomers, peptide nucleic acid (PNA)-oligomers and/or isolated nucleic acids based on the sequences of the genes are useful for detecting the methylation state of all the
                                                                                                                                                                                                                                1836 TAATAATTITITAAAACATTATTATAAAAATCGTCACAATTCTTTTTACTCAAAAAATA 7777

Pelet C;

Detecting and differentiating between hematopoietic cell proliferative disorders, comprises contacting a target nucleic acid with a reagent that distinguishes between methylated and non-methylated CpG dinucleotides.

Claim 28; SEQ ID NO 345; 117pp; English.

differentiating between haematopoietic cell proliferative disorders associated with at least 1 gene and/or their regulatory regions in subject. The method comprises contacting a target nucleic acid in a present invention describes a method for detecting and

```
dinucleotides within the target nucleic acid. Ma209861 to ABZ1118
represent specifically claimed nucleotide sequences from the present
invention. Oligonucleotides from the present invention can be used:
invention. Oligonucleotides from the present invention can be used:
differentiating between healthy haematopoietic cells and proliferative
disorder haematopoietic cells; for differentiating between acute
lymphocytic leukaemia and acute myelogenous leukaemia; as probes for
configuration the cytosine methylation state and/or single nucleotide
polymorphisms (SNPs) of haematopoietic cell proliferation disorder
related sequences and their complements; and as primers for the
muplification of haematopoietic cell proliferation disorder related DNA
sequences. The nucleotide sequences from the present invention can also
be used for detecting a predisposition to, differentiation between
cube used for detecting a predisposition to, differentiation between
the used adaposis, prognosis, treatment and/or monitoring of
haematopoietic cell proliferative disorders. The present method enables a
highly specific classification of haematopoietic cell proliferative
disorders allowing for improved and informed treatment of patients
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           4896 ААТТТАТТТАТАТАБАССАААТААААСТАТТАТААТССАСТАССАААТАТСАТТСААААА 4837

from MDR1, CSNKZB, EGR4, AR, CDK4, RB2, CDC25A, GPIb beta, WYOD1, CDH3, MYCL1, BELK1, ABL1, ARC, BCL1, CDH1, CDKN1A, CDKN1B, CDKN2B, FOS, MYCL1, ELK1, ABL1, ABL1, MOS, MYC, PTEN, RBL2, TGFBR2, TP73, CDKNIC, GSK3beta, ESR1, APAF1, BAK1, BAX or HOXAS. Oligomers, peptide nucleic acid (PNA)-oligomers and/or isolated nucleic acids based on the sequences of the genes are useful for detecting the methylation state of all the CpG dinucleotides within one or more the sequences, or their complements, for determining the cytosine methylation state and or single nucleotide polymorphisms (SNPS), and for differentiating at least two of the medical conditions such as diffuse large B-Cell lymphoma, mantle cell lymphoma, chronic lymphocytic leukemia, small lymphocytic lymphoma and follicular lymphoma. They are also useful for detecting of a predisposition to, insphenent subclasses, diagnosis, prognosis, treating and/or represents a nucleic acid of a pretreated genomic DNA derived from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             7896 AATTTATTTATATATAAACGAAATAAAACTATTATAAATCCACTACCAAATATGATTCAAAAA 7837
                                                                                         The invention relates to a method of detecting and differentiating between lymphoid cell proliferative disorders associated with at least one gene and/or their regulatory regions in a subject by contacting a target nucleic acid in a biological sample obtained from the subject with at least one reagent or series of reagents that distinguish between methylated and non-methylated CDG dinucleotides within the target nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        172 CTACGTTTCGTAGACTATTTTACATAAATAGTCTACACCGTTGTATACGCTCCAAATACA 231

The present invention relates to a method (M1) for identifying genes involved in plant resistance or response to pathogenic infection. M1 comprises identifying a gene whose expression is significantly altered in the incompatible interaction of plant gene expression relative to expression of the gene in an uninfected plant, in a mutant plant that does not express a gene associated with response to pathogenic infection, or in a corresponding incompatible or compatible interaction. (M1) is useful for conferring resistance to resistance or tolerance to a plant to bacterial, fungal or viral infection. The present sequence was used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   243

ABOT1212) from Listeria sp. The sequences are useful as probes and primers for identification and/or detection of Listeria (e.g. as contaminants in foods, or mutational analysis) and for analysis of gene expression. Proteins encoded by the nucleic acid sequences can be used to pathogenicity of Listeria (potential therappeutic agents), also for treating infections by Listeria, and are useful as immunogens in anti-Listeria vaccines. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp. wibo.int/pub/published_pot_sequences. (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                         New genomic sequences from Listeria species, useful for detection, treatment and prevention of infection, also related polypeptides, antibodies and modulators.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence

Patent No. 6703491

GENERAL INFORMATION:
GENERAL INFORMATION:
TITLE OF INVENTION: Nucleic acids and proteins of Drosophila melanogaster
FILE REPERENCE: File Reference: 7326-094
CURRENT APPLICATION NUMBER: US/09/270,767
CURRENT FILING DATE: 1999-03-17
NUMBER OF SEQ ID NOS: 62517
SOFTWARE: Patentin Ver. 2.0
SEQ ID NO 9827
LENGTH: 5003
                                                                       GENERAL INFORMATION:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 103863, Application US/09949016

Sequence 103863, Application US/09949016

Patent No. 681239

GENERAL INFORMATION:

APPLICANT: VENTER, J. Craig et al.

TITLE OF INVENTION: POLYMORPHISMS IN KNOWN GENES ASSOCIATED

TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF;

FILE REFERENCE: CLOOL 307

CURRENT FILING DATE: 2000-04-14

PRIOR APPLICATION NUMBER: 60/241,755

PRIOR FILING DATE: 2000-10-20

PRIOR FILING DATE: 2000-10-20

PRIOR FILING DATE: 2000-10-03

PRIOR FILING DATE: 2000-0-09-08

NUMBER OF SEQ ID NOS: 207012

SOFTWARE: PRESECTED NOS: 207012

Sequence 1, Application US/0989688BA

Patent No. US20020116723A1

GENERAL INFORMATION:

APPLICANT: The University of British Columbia

TITLE OF INVENTION: Insect Expression Vectors

FILE REFERENCE: 80021-44

CURRENT APPLICATION NUMBER: US/09/896,88BA

CURRENT APPLICATION NUMBER: US/09/048,911

PRIOR APPLICATION NUMBER: 05/09/048,911

PRIOR FILING DATE: 1998-03-26

PRIOR FILING DATE: 1997-03-27

NUMBER OF SEQ ID NOS: 50

SEQ ID NO 1
